BRIA BY BRIGHTHOUSE

Phase 1 Product Specification

Lean Solo-Build MVP — AI Chat + Smart Inventory

Prepared for	Product Owner Review
Version	2.0 — Revised
Date	June 2026
Scope	Phase 1 MVP — Solo Build
Primary Market	United States · Philippines · Australia
Concierge	One dedicated VA (human support)

This document reflects a revised, solo-builder-friendly Phase 1 scope. Complexity has been deliberately reduced — the goal is to ship something real, validate that users love talking to Bria, and build Phase 2 on proven ground.

Executive Summary

Bria is the household intelligence layer — not a chore tracker, not a grocery app, not a generic AI chatbot. Phase 1 proves one thing: that talking to Bria feels natural, useful, and unlike anything else on the market.

What ships	Onboarding · Auth · Bria AI Chat · Inventory via chat + Upload Receipt · Basic dashboard · Task list
What does NOT ship	Meals / Cook What I Have · Vault · Vendors · Cleaner/DIY toggle · Stripe billing · OCR scanning · Delivery API integrations
Concierge	One VA handles requests. Routed via Slack/email. No portal needed in Phase 1 — just a request form.
Timeline	10–12 weeks solo to App Store submission (realistic, not optimistic)
Stack	React Native · Node.js + Fastify · Supabase · Claude 3.7 Sonnet · Postmark (email parsing)

A Note on Solo Build Scope

The original prototype covers 10 screens and a wide feature set — it is an excellent vision document. But for one person to ship a quality product, scope must be ruthlessly cut. The rule applied here: **if it does not prove that Bria is useful, it does not ship in Phase 1.**

The full prototype remains the design source of truth for Phase 2. Nothing is thrown away — it is just sequenced correctly.

Screen / Feature	Phase 1	Phase 2
Onboarding (4 steps)	**Yes**	—
Auth (email + social)	**Yes**	—
Bria AI Chat	**Yes**	—
Basic dashboard	**Yes**	—
Task list	**Yes**	—
Inventory via chat	**Yes**	—
Upload Receipt button	**Yes**	—
Concierge request form	**Yes (simple)**	Full VA portal
Cleaner / DIY mode toggle	**No**	Yes
Meals + Cook What I Have	**No**	Yes
Household Vault	**No**	Yes
Vendors screen	**No**	Yes
Supplies screen	**No**	Yes (with delivery APIs)
Stripe / subscription	**No**	Yes
Receipt OCR / photo scan	**No**	Yes
Instacart / GrabMart APIs	**No**	Yes
Staff portal	**No**	Yes
Budget tracking	**No**	Yes

Phase 1 Feature Detail

Complexity	Low	Medium	High	Tier	Free	Premium	VA

Feature 1 — Auth + Onboarding

The foundation. Without it Bria has no household context and there is no user.

Capability	Description	Complexity	Tier
Email + social sign up/in	Supabase Auth — email, Google, Apple	Low	Free
4-step onboarding	Household size, staff presence, dietary needs, reminder preferences	Low	Free
Household profile	Stored in Supabase. Passed to Claude as system prompt context every turn	Low	Free
Multi-member access	Invite partner / family member to same household — real-time sync	Medium	Free

Feature 2 — Bria AI Chat

The hero interaction and the entire product bet. Users talk to Bria in natural language. Bria responds with a warm, calm, premium voice — and actually does things.

Capability	Description	Complexity	Tier
Natural language input	User types freely in English (Tagalog support available via system prompt)	Low	Free
Household-aware context	Onboarding data seeds Bria's system prompt on every conversation turn	Medium	Free
Quick-suggest chips	Pre-built prompts: What do we need? / Add to list / Any tasks today?	Low	Free
Conversation history	Per-household chat log in Supabase — Bria remembers past context	Low	Free
Inventory queries	"What do we have?" — Bria reads inventory state and responds naturally	Medium	Free

Task creation from chat	"Remind me to clean the fridge Sunday" — appears in task list automatically	**Medium**	**Free**
Shopping list via chat	Bria compiles low-stock + user requests into an organised list	**Medium**	**Premium**
Proactive nudges	Bria surfaces low stock or upcoming tasks unprompted — push notification	**Medium**	**Premium**

Feature 3 — Household Inventory

The first concrete use case Bria acts on. Chat is the primary input. The Upload Receipt button is the shortcut — it hides email forwarding behind familiar UX, and will be upgraded to OCR in Phase 2 without the button ever changing.

Capability	Description	Complexity	Tier
Inventory state	Database tracks item, quantity, category, unit, low threshold, last updated	**Low**	**Free**
Chat-driven updates	"Bria, I bought 2kg rice" — Bria parses and updates inventory automatically	**Medium**	**Free**
Manual entry	User can add/edit items directly in the supplies list	**Low**	**Free**
Low stock detection	Bria flags items below threshold — surfaced in dashboard and chat	**Low**	**Free**
Upload Receipt button	Phase 1: forwards email to receipts@getbria.com, Claude extracts items as text	**Medium**	**Free**
	Phase 2 upgrade: same button triggers camera OCR — UX never changes		
One-tap order handoff	Shopping list shows deep link to Instacart / Amazon Fresh — no API, just a link out	**Low**	**Free**
Consumption patterns	Data model built to support pattern learning in Phase 2 — foundation only	**Low**	**Free**

Feature 4 — Brighthouse Concierge

One dedicated VA handles whatever the app cannot automate yet. Requests come through a simple in-app form and route to the VA via Slack/email. No portal, no ticketing system needed in Phase 1.

Capability	Description	Complexity	Tier
Request form	5-field in-app form: name, request type, description, urgency, contact pref	Low	VA
VA routing	Submission triggers Slack message + email to VA — manual handling from there	Low	VA
Pricing display	Intro $75 / Standard from $100 / Monthly from $350 — shown before submit	Low	VA
Separation clarifier	Clear UI copy: Concierge is separate from the app subscription	Low	VA

Upload Receipt — Technical Design

The Upload Receipt button is a UX wrapper that hides the technical implementation from the user. In Phase 1 it uses email parsing. In Phase 2 it uses OCR. The button never changes.

Phase	What User Does	What Happens Behind the Button	Tech
Phase 1	Taps Upload Receipt, selects From Email, forwards any grocery receipt email to their unique Bria address	Postmark webhook receives email, passes to Node.js, Claude extracts items + quantities as plain text, inventory updates	**Postmark inbound + Claude API**
Phase 2	Taps Upload Receipt, selects Take Photo	Camera captures receipt, OCR engine extracts text, Claude parses items + quantities, inventory updates	**OCR + Claude API**
Phase 2+	No action needed	Instacart / GrabMart / Woolworths API pushes purchase data directly — inventory updates automatically on order completion	**Delivery partner APIs**

Each household gets a unique inbound email address (e.g. home-a3f9@receipts.getbria.com). One-time setup: user adds it as a contact and forwards receipts whenever they shop. Bria processes it silently — no manual input required after setup.

Monetisation — Free vs Premium vs Concierge

App subscriptions and Concierge are always separate products. Stripe billing is deferred to Phase 2 — Phase 1 ships free to maximise early signups and validation.

Plan	Price	What's Included	Phase
Free	**$0**	Auth, onboarding, Bria chat (basic), inventory via chat, task list, manual inventory entry, Upload Receipt	**Phase 1**
Premium AI	**$9.99/mo or $69.99/yr**	Everything in Free + smart shopping list, proactive nudges, expanded inventory history, priority chat responses	**Phase 2**

Brighthouse Concierge	**$75–$350/mo**	One dedicated VA. Separate from app plan entirely. Handles what the app cannot automate. Routed via Slack/email in Phase 1.	**Phase 1 (form only)**

Technology Stack

Layer	Technology	Rationale
Mobile App	**React Native + Expo**	Single codebase iOS + Android. Expo handles push notifications, camera, and App Store submission tooling.
API Backend	**Node.js + Fastify**	Lightweight and fast. Handles AI requests, email webhooks, inventory logic. Deploy on Railway — free to start.
Database / Auth	**Supabase (Postgres)**	Relational DB + RLS for household isolation + Auth + Realtime + Storage. Free tier covers first 50K MAU.
AI / Chat	**Claude 3.7 Sonnet**	Best instruction-following for Bria's voice and persona. Prompt caching cuts costs 80% at scale.
Email Parsing	**Postmark (inbound)**	Receives forwarded receipts, fires webhook to Node.js. Claude extracts items as plain text — no OCR needed.
Push Notifications	**Expo Notifications + FCM**	iOS + Android in one call. Required for proactive nudges and reminders.
Payments	**Stripe (Phase 2)**	Subscription billing deferred. Phase 1 ships fully free.

Development Timeline — Solo Build

Realistic estimate for one person building full-time. Part-time adds 4–6 weeks. Timeline assumes welcome variant, bundle ID, and App Store enrollment are decided before Week 1.

Week	Milestone	Deliverables	Risk
1–2	**Foundation**	React Native scaffold · Supabase schema · Auth (email + Google + Apple) · Nav structure	**Low**
3–4	**Onboarding + Profile**	4-step onboarding · Household profile · Feeds Claude system prompt	**Low**
5–6	**Bria AI Chat**	Claude API integration · Chat UI · Quick-suggest chips · Conversation history	**Medium**

7–8	**Inventory + Upload Receipt**	Inventory data model · Chat-driven updates · Postmark email webhook · Upload Receipt UX	**Medium**
9	**Dashboard + Tasks**	Basic dashboard · Task list · Low stock indicators · Shopping list	**Low**
10	**Concierge Form**	Request form · Slack/email routing to VA · Pricing display · Separation clarifier	**Low**
11	**Polish + QA**	Empty states · Error handling · Bria voice QA · Device testing (iOS + Android)	**Low**
12	**Beta + Submission**	TestFlight · Google Play Internal Track · 20–50 beta users · App Store submission	**Medium**

Success Metrics — Phase 1

Metric	Target	Why It Matters
Beta signups	**200+**	Validates demand. US-first, Philippines secondary.
Chat sessions per user / week	**3+**	Is Bria becoming a daily habit?
Inventory items tracked / household	**10+**	Validates the intelligence layer use case
Upload Receipt activations	**>40% of users**	Confirms the email parsing UX is clear enough
D7 retention	**>40%**	Core health metric — are users coming back?
NPS from beta	**>50**	Premium positioning requires premium satisfaction
Onboarding completion rate	**>70%**	Drop-off here means Bria never gets context to be useful
Concierge request submissions	**5+ in Week 12**	Validates willingness to pay for human support

Decisions Needed Before Development Starts

#	Decision	Options	Owner
1	**Welcome screen variant**	A — Calm (cream) · B — Warm (sage+gold) · C — Bright (coral)	**Product Owner**
2	**Bundle ID**	com.brighthouse.bria OR com.getbria.app	**Product Owner**
3	**Domain registration**	Register bria.app + getbria.com together (recommended)	**Product Owner**
4	**App Store enrollment**	Enroll Brighthouse as developer on Apple + Google Play	**Founder**
5	**Onboarding: 4 steps or 8 steps?**	Lean 4-step (recommended) vs full 8-step from prototype	**Product Owner**
6	**Beta recruitment strategy**	How will first 200 US users be sourced for TestFlight?	**Product Owner**

Phase 1 is about one thing: proving that Bria feels like a real assistant, not another app. Ship small. Validate fast. Build Phase 2 on users who already love it.
